[linkedin.com/in/naga-vamshi-battu](https://www.linkedin.com/in/naga-vamshi-battu)

SKILLS

Languages: JavaScript, TypeScript, Python, Java **Frontend:** Vue.js, Vuetify, HTML5, CSS, CKEditor 5
Backend: Node.js, Express.js, Loopback, REST APIs, WebSocket APIs
Cloud & AI: AWS (Step Functions, Lambda, Bedrock, S3, API Gateway, SSM), OpenAI API, Cohere API, LangChain, RAG, Vector Embeddings **Tools:** MongoDB, Git, GitHub, Docker, n8n, SST, Webhooks

WORK EXPERIENCE

Applaud Solutions Aug 2023 - Present
Software Engineer Hyderabad, India

- Developed and operated features for a **multi-tenant SaaS platform** supporting 50+ enterprise tenants, building modular backend services in loopback and MongoDB. Reduced tenant onboarding time by 40% while maintaining strict tenant isolation.
- Contributed to redesigning multi-tenant data storage by consolidating tenant-specific collections into a single shared collection with field aliasing, reducing MongoDB cluster requirements from **M40/S40 to M20/S20** and achieving **~44% cost savings** (\$25k → \$14k). Owned data migration pipelines, MongoDB and Atlas Search index creation on alias fields, and the transparent mapping layer for alias-to-original field conversion.
- Built automated data consistency and reconciliation pipelines to validate and repair **10,000+ tenant records**, improving system correctness to **99.9% data accuracy** and eliminating manual remediation.
- Integrated AWS Bedrock-based AI services into custom CKEditor 5 plugin, enabling AI-assisted content workflows for **200+ daily active users**, while enforcing request throttling and tenant-level isolation.
- Re-architected frontend build system to support enterprise-specific deployment requirements, enabling asset load- ing from internal HTTP servers instead of standard CDN paths. Delivered custom-branded offline builds under tight deadlines, **directly contributing to securing enterprise clients**.
- Improved end-to-end application performance by implementing lazy loading, code splitting, and asset compression, reducing page load time by **~45%** and improving feature rollout velocity by **30%**.

EDUCATION

Gokaraju Rangaraju Institute of Engineering & Technology, Hyderabad Aug 2019 - May
2023 B.Tech in Computer Science and Engineering

PROJECT WORK

- RAG-Powered Document Intelligence Platform:** Built production-grade conversational system using retrieval- augmented generation (RAG), supporting ingestion of PDF, DOCX, CSV, TXT, and Markdown files. Designed asynchronous embedding pipeline processing **100+ documents/hour**, using parent-child document schemas and vector similarity search to achieve **<200ms p95 query latency**. Implemented cosine similarity-based retrieval with pre-filtered candidate sets to improve relevance accuracy to **~95%**.
Tech: Vue.js, Node.js, MongoDB, Cohere API, Vector Embeddings.
- Automated Code Review Platform:** Designed event-driven automation system using GitHub webhooks and n8n, triggering automated pull-request analysis across **20+ developers**. Reduced annual tooling costs by **~99%** (\$9,600 → \$120) while cutting review turnaround time by **~50%** through automated static analysis and AI-assisted feedback.
Tech: n8n, JavaScript, GitHub API, OpenAI, LangChain, Webhooks.
- Enterprise RAG Conversational AI Platform:** Developed a multi-tenant, multi-channel AI conversation service supporting real-time streaming, feedback capture, and persistent chat history across web and enterprise messaging platforms. Engineered production RAG search using Amazon Bedrock embeddings and MongoDB Atlas Vector Search with context-aware chunk relationships and relevance thresholds. Integrated Role-Based Access Control, tenant quota controls, and token metering to optimize LLM cost and governance. Improved retrieval performance under complex filters via progressive vector fetching and Lambda connection reuse.
Tech: TypeScript, Node.js, AWS Serverless (Lambda, API Gateway, EventBridge), MongoDB Atlas, Amazon Bedrock

CERTIFICATIONS

- MongoDB Node.js Developer Path:** MongoDB University - June 2025 (CRUD Operations, Aggregation Pipelines, Performance Optimization, Node.js Integration)
