SUMMARY:

Full-stack developer with 2 years of experience building and optimizing scalable web applications. Experienced in developing custom features, resolving complex bugs, and enhancing performance across large, multi-tenant platforms. Strong collaborator with a focus on clean architecture, testing, and delivering seamless user experiences.

Education :

Gokaraju Rangaraju Institute of Engineering & Technology, Hyderabad, Telangana | Bachelor of Technology in Computer Science and Engineering | Aug 2019- May 2023

Experience :

Software Engineer (SE) - Applaud Solutions | August 2023 - present

- Built and enhanced tenant-based web applications using Vue.js, Loopback, and MongoDB, ensuring modularity and scalability.
 - Played a key role in **redesigning MongoDB schema architecture**, improving data consistency and query performance across critical workflows.
 - Developed **backend scripts** to detect and resolve data inconsistencies, maintaining integrity across multi-tenant databases.
 - Created and extended **CKEditor 5 custom plugins**, including integrations with **AWS Bedrock**, video embedding, and iframe support.
 - Contributed to the development and enhancement of an **offline UI interface**, enabling seamless user experience in low-connectivity environments.
 - Collaborated with product, QA, and engineering teams to deliver secure, configurable features deployed across multiple tenants.
 - Regularly improved performance by optimizing database queries, frontend asset loading, and removing unused CSS/JS resources.
 - Authored internal documentation and contributed to plugin modularization and reusable design patterns across the codebase.
-

Projects :

RAG-Powered Chatbot with Document-Aware Intelligence

Tech Stack: Vue.js, Node.js, MongoDB, Cohere API

- Built a ChatGPT-style chatbot using **Retrieval-Augmented Generation (RAG)** to deliver context-aware responses from user-uploaded documents.
- Developed ingestion pipeline supporting **PDF, DOCX, TXT, CSV, and Markdown** with dynamic chunking and **1024-dimensional vector embeddings** via Cohere API.
- Designed an **embedding queue with background processing** in Node.js to efficiently handle small and large documents using parent-child record structures in MongoDB.
- Implemented **automatic re-embedding on document updates** by detecting changes and regenerating embeddings.
- Performed **cosine similarity-based vector search** to retrieve top-ranked chunks and used Cohere's Generate API for grounded, document-aware answers.

Impact: Enabled knowledge-based Q&A with accurate, real-time responses, improving document search and support workflows.

Code Review Bot (n8n Automation Project)

Tech Stack: n8n, JavaScript, GitHub API, OpenAI (ChatGPT), REST APIs, Webhooks

- Developed an **automated code review bot** using **n8n workflow automation**, integrating GitHub pull requests with AI-driven feedback.
- Configured **GitHub triggers** to detect PR creation or comments mentioning the bot, and implemented **conditional checks** to process only open PRs and valid bot mentions.
- Fetched PR file diffs and content using GitHub API, including handling binary and text files, and prepared **structured prompts** for AI review. Built a **prompt-generation module** in n8n to transform PR diffs into detailed, file-by-file code review instructions for the OpenAI Chat model (ChatGPT-4o-latest).
- Used the **LangChain agent node** to generate actionable AI-based review comments, covering logic, best practices, performance, security, and maintainability.
- Automatically posted **AI-generated comments back to GitHub** and applied **labels** (e.g., **ReviewedByAI**) to streamline review tracking.
- Implemented **batch processing and iterative loops** to handle large PRs efficiently, ensuring scalability and reliability of the automation.

Impact:

- Reduced manual review effort by **30–40%**.
 - Provided consistent, constructive, and educational code feedback for developers.
 - Accelerated PR review cycles and improved overall code quality across multiple repositories.
-

AWS Bedrock AI Agent Platform (Full-Stack Development Project)

Tech Stack: Vue.js 3, Node.js, AWS Bedrock Agents, AWS SDK v3, Express.js, Vuetify 3, Pinia, SCSS

- Developed a **full-stack AI chatbot platform** integrating AWS Bedrock Agents with a Vue.js 3 frontend featuring **glassmorphism UI** and real-time messaging.
- Architected **Node.js backend with Express.js API**, implementing session management, streaming responses, error handling, and tool-based agent workflows.
- Built **responsive frontend** with Vuetify 3, featuring real-time chat interface, persistent session storage, message actions, typing indicators, and advanced state management via Pinia.
- Implemented **AWS SDK v3 integration**, streaming response processing, chat export, session persistence, and a comprehensive testing suite for reliability.
- Enhanced user experience with **real-time connection monitoring**, graceful error recovery, and mobile-responsive layout.

Impact: Delivered an **enterprise-ready AI chatbot solution**, ensuring scalable AWS cloud integration and improving development efficiency through modular architecture and comprehensive documentation.

Certificates:

MongoDB Node.js Developer Path

MongoDB University – Completed [June,2025]

(Covers: MongoDB CRUD, Aggregation, Performance, and Integration with Node.js)
